## Thank you for choosing NatureMetrics

Welcome to your report. We are the leading provider of powerful, scalable biodiversity data delivered using environmental DNA.

Your report consists of:
This document: providing you with our world class insights and metrics.
Data Tables: Accompanying spreadsheet with results at the individual sample level: metrics, quality control and species detected. NM-NMA625.SO01503.Vertebrates.Results.xlsx.

Throughout the report you'll see reference to OTUs. This stands for Operational Taxonomic Unit; an OTU is broadly equivalent to a species in most cases.

Please be careful when sharing this report, it contains biodiversity information that may be sensitive, particularly with respect to endangered or protected species. Please share responsibly. If the report is shared, we kindly ask that the report is shared in its entirety - to limit the possibility of any information being taken out of context.

New to our reports? Our Report Interpretation Guide is here to help.
Something exciting or unexpected that you'd like to discuss further, our team of experts are looking forward to speaking with you.

## Executive Summary

| Field Samples submitted: | 80 |
| :--- | :--- |
| Field Samples reported: | 29 |
| Field Blanks submitted: | 0 |
| Total number of OTUs detected: | 27 |
| Average number of OTUs per sample: | 3 |
| Total number of IUCN Threatened Species: | 1 |
| Total number of Invasive Species: | 2 |

Reported samples are those that passed Quality Control and are included in the Species Data Table

## REPORT

## Overview of Species Detected

This chart provides a tree-of-life view of the species detected in your samples and their taxonomic relationship, (names on the same branch are more similar than those on different branches). The chart is structured with the highest taxonomic rank at the centre (e.g., kingdom, phylum, class), moving through the ranks of order, family, genus, species as you move to the outer edge. Note that the centre and outer ranks will change depending on the test applied and the number of species detected. The legend in the bottom right of the chart indicates how to relate the colour in the branches to the number of species. The colour scale goes from grey indicating very few species to blue indicating a lot of species.

## Taxonomic Resolution

This table provides the number of OTUs detected and the percentage of OTUs identified to each taxonomic level.

Depending on completeness of reference databases for the region where you sampled, some OTUs may not match to a reference at species level. Global DNA reference databases contain millions of barcodes, but gaps remain, particularly in regions and taxonomic groups that are more diverse and less studied. Coverage is expected to improve over time and data tables can be updated to include new information at a future date.

| Number of OTUs | Phylum | Class | Order | Family | Genus | Species |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 27 | $100 \%$ | $100 \%$ | $100 \%$ | $100 \%$ | $86.21 \%$ | $75.86 \%$ |

Want to increase the number of species named to species level?
If you have specimens of species you have identified, we can sequence the DNA and add the species to our reference databases. We will then be able to enhance the reference library and report if the species is detected. Please contact us about this service and we can send you our barcoding kits but note that we only offer these kits for fish and amphibians.

## IUCN Threatened Species

These are the IUCN (International Union for Conservation of Nature) Red List species detected in your samples. These are detected species that are designated as one of the IUCN Red List Threatened Categories (Vulnerable, Endangered and Critically Endangered). An increase in the number of threatened species is generally associated with a positive trend in biodiversity or habitat condition.

| Species | Common name | Threat Status |
| :--- | :--- | :---: |
| Anguilla anguilla | European Eel | Critically Endangered |
| Number of species |  | 1 |

The Data Tables contain further information for all species, including their designations as Least Concern or Near Threatened status.

## Invasive Species

These are Invasive species detected in your samples. These species are invasive according to the Global Register of Introduced and Invasive Species (GRIIS) in the country where sampling occurred. GRIIS is an IUCN Invasive Species Specialist Group initiative. An invasive species is a species whose introduction and/or spread threatens biological diversity (Convention on Biological Diversity). An increase in the number of invasive species is generally associated with enhanced pressures at your site and reduced resilience of the native community. Note that this label is only available for animals.

## Community Composition

This chart lists the species found in each sample. A bubble means a species was detected in that sample. The chart displays at species level, unless the number of species is too great to display clearly in the document. In this case, the chart displays at a higher taxonomic level. The full species level chart is provided as an appendix.

The size of the bubbles represents the proportion of DNA sequences within a sample. A larger bubble size can indicate a stronger eDNA signal. This signal may be linked to abundance of species in the environment but should be interpreted only as a coarse measure because the signal is also impacted by biological (e.g., biomass, life stage, activity, body condition), environmental (e.g., temperature, pH, salinity, conductivity), and technical factors (e.g., primer bias, PCR stochasticity).

## Looking for something more?

We also offer comparative reporting. This includes statistical comparison of metrics and communities according to categories that you define. For instance, these might include waterbody, Site, Management Regime, or anything else that is a focus of your project. Please contact us for further details.

## END OF REPORT

NATURE<br>METRICS<br>DNA.BASED MONITORING

Thank you for choosing NatureMetrics
Please read the following information to help you understand the data in this file. For more information on how to interpret your results please see our Report Interpretation Guide. This file contains four tables: Species Data Table Percentages, Species Data Table Read Counts, Metrics by Sample Table, Quality Control Table Species Data Table Percentages
This table provides a list of all the species detected in each of your samples. Where a species was detected in a sample, the percentage of DNA sequences assigned to that species is provided. A dash indicates that the species was not detected in the sample. Additionally, for each species the following is included:

- The OTU DNA sequence
- The taxonomic identification: Kingdom, Phylum, Class, Order, Family, Genus, Species
- The Common Name*
- IUCN Threat Status^
- Invasive status: A Yes/No status indicating whether the species is listed as invasive in the country the sample was taken from*
- Target Status: Our tests are targeted to detect certain groups of species, but species outside these targeted groups are sometimes detected incidentally. We call these Non-Targets. Non-Targets can
* Only available for species named at the species level
$\wedge$ Only available for species named at the species level and not applicable for Bacteria
Species Data Table Read Counts
This table is very similar to the Species Data Table Percentages table, but Read Counts (the number of DNA sequences assigned to a species) are reported for each species in each sample rather than the percentage of DNA sequences. This is useful if you intend to publish results or intend to run further

Metrics by Sample Table
This table provides the metric values for each sample for each applicable metric. More information on how each metric is calculated is provided in the Report Interpretation Guide. The available metrics are:

- Species Richness
- Evolutionary Diversity
- IUCN Threatened Species (Not applicable to: Bacteria)
- Invasive Species (Not applicable to: Bacteria, Soil Fungi, Marine Sediment Eukaryotes, Marine Aquatic Eukaryotes)
- Bacterial Functional Diversity (Applicable only to: Bacteria)
- Fungal Functional Diversity (Applicable only to: Soil Fungi)
- Fungal:Bacterial Ratio (Applicable only to: soil samples)
- Fish Food-Chain Integrity (Applicable only to: Fish (excl sharks \& rays), Vertebrates, marine samples)
- Fish: Commercial Value (Applicable only to: Fish (excl sharks \& rays), Vertebrates, marine samples)

Quality Control Table
This table provides information on each sample, an overview of how each sample progressed through each of our quality control steps and shows the outcome of what is reported. More information on each Quality Control step is provided in the Report Interpretation Guide. The table is comprised of four sections

Sample Information

- Kit ID
- Client Label: The name you gave to your sample
- Sample Type: This will be either ‘Field sample’ or 'Field blank'
- Volume Filtered (Applicable only to aquatic kits)
- Date Received - This is the date the sample was received at NM labs

Quality Control

- DNA Amplified (Yes/No): This shows if target DNA was amplified and sequenced
- Passed Data QC (Yes/No): This shows if a sequenced sample contained high quality data
- Target OTUs Detected (Yes/No): This shows if target species were detected. Our tests are targeted to detect certain groups of species

## Percentage Reads

- \% Target: The percentage of target species DNA sequences that were identified in the sample
- \% Non-Target: The percentage of reads belonging to non- target species DNA sequences that were identified in the sample
